

Editorial

The current issue of *AJWEP*, in its 15th year of publication, includes papers presented as usual alongwith some articles from ICEPM, 2017.

With oil prices sky rocketing in domestic and international markets, there seems to be no urgency to talk about climate change and pollution control. With increasing use of shale oil extraction and consumption by some countries including USA, China and India, there is an urgent need to look for implementable alternate source of energy that also has to be affordable to emerging economies in the world. While hydrogen battery may be the final solution, it is a far cry in the present scenario and mankind cannot wait too long for a friendly alternative. Hopefully global researchers will roll up their sleeves and plunge into this problem with full force.

Happy reading.
