

Supplementary Material 2

Dynamic Causal Modeling of Preclinical Autosomal-Dominant Alzheimer's Disease

Cognitive Trajectories

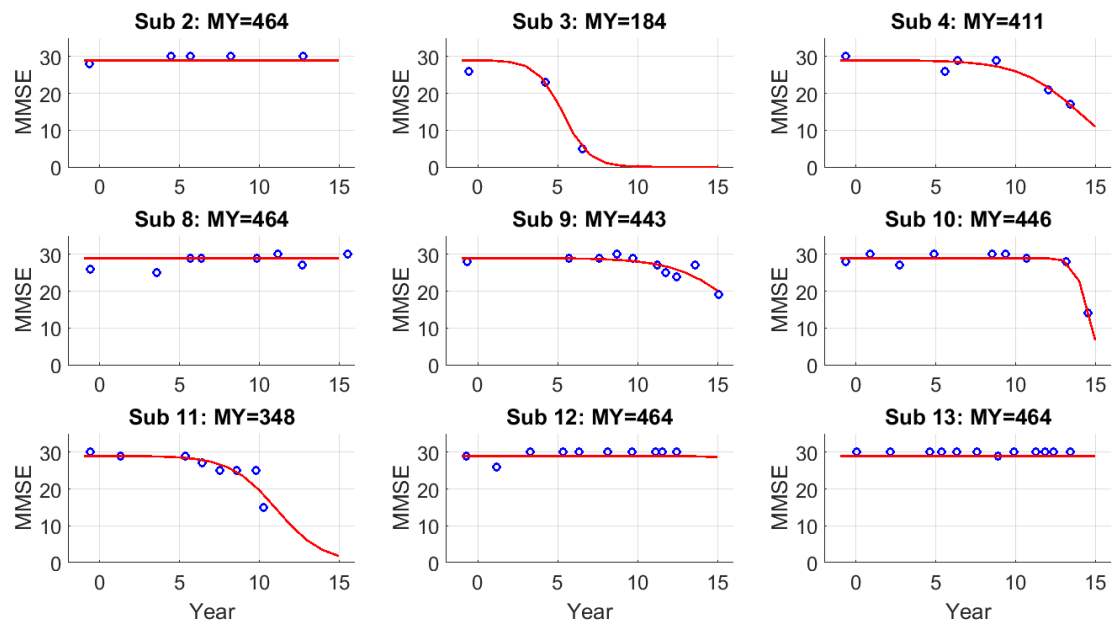

Fig. 1. MMSE Trajectories. Mini-Mental State Exam (MMSE) trajectories during follow-up period for 9 subjects from the PreC group (the ones not shown in the main paper). The x-axis labels Year with 0 corresponding to 2000. The EEG data were acquired in 1999. Blue dots denote measured MMSE scores and the red line indicates the trajectory estimated using a logistic decay model. The MY values above each plot correspond to MMSE-Years, computed as the integral under the curve.
