

Erratum

Increased Risk of Dementia in Subjective Cognitive Decline if CT Brain Changes are Present

Simona Sacuiu, Marie Eckerström, Lena Johansson, Silke Kern, Robert Sigström, Xinxin Guo, Svante Ostling, Ingmar Skoog

[*Journal of Alzheimer's Disease*, **66**(2) 2018, 483-495, DOI 10.3233/JAD-180073]
<https://content.iospress.com/articles/journal-of-alzheimers-disease/jad180073>

On page 487, the following note for Figure 1 is given:

Fig. 1. SCD flow chart using the total sample followed during 2000–2012. Three participants at follow-up had no self-reported cognitive data at the examination 2005 (of these, one individual was diagnosed with dementia in 2006 and another in 2009). Dementia diagnosis in those lost to follow-up ($n = 35$ deceased and refusals) was based on the Swedish Hospital Discharge Register if not otherwise specified; all other dementias were diagnosed at the examinations 2005 and 2009 ($n = 111$) except for *five dementias in participants 2005–2009 retrieved from the Register during the follow-up 2010–2012 ($n = 2$ among SCD2005 & SCD2009 = 0 and $n = 3$ among SCD2005 = 0 of which only 1 developed SCD2009 = 1).

However, the correct note is as follows:

Figure 1 SCD flow chart using the total sample followed during 2000–2012. Three participants at follow-up had no self-reported cognitive data: $n = 2$ at the examination 2005 (of these one individual was diagnosed with dementia 2006) and $n = 1$ at the examination 2009. Dementia diagnosis in those lost to follow-up ($n = 35$ deceased and refusals) was based on the Swedish Hospital Discharge Register if not otherwise specified; all other dementias were diagnosed at the examinations 2005 and 2009 ($n = 111$) except for *five dementias in participants 2005–2009 retrieved from the Register during the follow-up 2010–2012 ($n = 2$ among SCD2005 & SCD2009 = 0 and $n = 3$ among SCD2005 = 0 of which only 1 developed SCD2009 = 1).
