Supplementary Figure 1. Schematic drawing of splicing and transcription between exon 10 and exon 12 of *GRN*. A) Normal splicing and transcription between adjacent exons of *GRN* (wild type). B) Aberrant splicing and skipping of exon 11 due to the 45bp deletion in the important splicing site. C) The deletion at the beginning of exon 11 in *GRN* makes an early termination in amino acid production, which is expected to lead to a frameshift and a premature stop codon (p. Val473Argfs*8). *termination at the TGA stop codon generated.
