AD, Alzheimer’s disease; BASQID, Bath Assessment of Subjective QoL in Dementia; CI, confidence interval; HRQoL, health-related quality of life; LSMC, least squares mean change (from MMRM model); MMSE, Mini-Mental State Examination; MCI, mild cognitive impairment; MILD AD, mild dementia due to AD; NA, not applicable; SE, standard error.

Patients with both MMSE and outcomes measured at baseline visit and 36-month visit (outcome analysis set) were included in the analyses (change from baseline to 36 months). The linear regression model was performed for change in BASQID from baseline to 36 months. Separate models were fitted for MCI and MILD AD, respectively. All models included baseline value, change in MMSE from baseline to 36 months, age, number of comorbidities, and study partner relationship.

AD, Alzheimer’s disease; CI, confidence interval; GLM, generalized linear model; LSMC, least squares mean change (from MMRM model); MMSE, Mini-Mental State Examination; MCI, mild cognitive impairment; MILD AD, mild dementia due to AD; NA, not applicable; RUD, Resource Utilization in Dementia questionnaire; SE, standard error.

Patients with both MMSE and outcomes measured at baseline visit and 36-month visit (outcome analysis set) were included in the analyses (total over 36 months). The general linear model was performed for total caregiver time. The GLM with log link and gamma distribution was performed for total societal cost. Separate models were fitted for MCI and MILD AD, respectively. All models included baseline MMSE, change in MMSE from baseline to 36 months, age, number of comorbidities, and study partner relationship. Caregiver time capped at 540 hours/month.
